Date:

September 2015

Statement of Qualifications and Limitations

The attached Report (the "Report") has been prepared by AECOM Canada Ltd. ("Consultant") for the benefit of the client ("Client") in accordance with the agreement between Consultant and Client, including the scope of work detailed therein (the "Agreement").

The information, data, recommendations and conclusions contained in the Report (collectively, the "Information"):

- is subject to the scope, schedule, and other constraints and limitations in the Agreement and the qualifications contained in the Report (the "Limitations");
- represents Consultant's professional judgement in light of the Limitations and industry standards for the preparation of similar reports;
- may be based on information provided to Consultant which has not been independently verified;
- has not been updated since the date of issuance of the Report and its accuracy is limited to the time period and circumstances in which it was collected, processed, made or issued;
- must be read as a whole and sections thereof should not be read out of such context;
- was prepared for the specific purposes described in the Report and the Agreement; and
- in the case of subsurface, environmental or geotechnical conditions, may be based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time.

Consultant shall be entitled to rely upon the accuracy and completeness of information that was provided to it and has no obligation to update such information. Consultant accepts no responsibility for any events or circumstances that may have occurred since the date on which the Report was prepared and, in the case of subsurface, environmental or geotechnical conditions, is not responsible for any variability in such conditions, geographically or over time.

Consultant agrees that the Report represents its professional judgement as described above and that the Information has been prepared for the specific purpose and use described in the Report and the Agreement, but Consultant makes no other representations, or any guarantees or warranties whatsoever, whether express or implied, with respect to the Report, the Information or any part thereof.

Without in any way limiting the generality of the foregoing, any estimates or opinions regarding probable construction costs or construction schedule provided by Consultant represent Consultant's professional judgement in light of its experience and the knowledge and information available to it at the time of preparation. Since Consultant has no control over market or economic conditions, prices for construction labour, equipment or materials or bidding procedures, Consultant, its directors, officers and employees are not able to, nor do they, make any representations, warranties or guarantees whatsoever, whether express or implied, with respect to such estimates or opinions, or their variance from actual construction costs or schedules, and accept no responsibility for any loss or damage arising therefrom or in any way related thereto. Persons relying on such estimates or opinions do so at their own risk.

Except (1) as agreed to in writing by Consultant and Client; (2) as required by-law; or (3) to the extent used by governmental reviewing agencies for the purpose of obtaining permits or approvals, the Report and the Information may be used and relied upon only by Client.

Consultant accepts no responsibility, and denies any liability whatsoever, to parties other than Client who may obtain access to the Report or the Information for any injury, loss or damage suffered by such parties arising from their use of, reliance upon, or decisions or actions based on the Report or any of the Information ("improper use of the Report"), except to the extent those parties have obtained the prior written consent of Consultant to use and rely upon the Report and the Information. Any injury, loss or damages arising from improper use of the Report shall be borne by the party making such use.

This Statement of Qualifications and Limitations is attached to and forms part of the Report and any use of the Report is subject to the terms hereof.

1. Introduction

In 2011 and 2012, LGL Limited (LGL) collected field data to determine baseline conditions within the Henvey Inlet Wind Energy Centre (HIWEC) study area. The data collected by LGL included:

- Raptor Migration;
- Passerine Migration;
- Breeding Birds;
- Herpetological Surveys; and
- Bat Acoustic Monitoring.

In 2013, Stantec Consulting Ltd. (Stantec) continued field data collection within the HIWEC study area. The data collected by Stantec included:

- Raptor Migration;
- Passerine Migration;
- Waterfowl Migration;
- Breeding Birds;
- Herpetological Surveys;
- Bat Acoustic Monitoring;
- Ecosite Classification and Rare Flora;
- Herpetological Incidental Observations; and
- Other Incidental Wildlife Observations.

This report has been prepared by AECOM to summarize the 2011 to 2013 ***Herpetological Surveys*** field data for the HIWEC study area. This is based on raw field data and GIS data collected by LGL and Stantec during the 2011, 2012, and 2013 seasons. This information was provided to AECOM by Stantec in October 2014 and by WSP for the LGL data in May 2015. The following provides the work plans written by LGL and Stantec which outline data collection methods as well as AECOM's summary and analysis of the data collected, and assumptions made concerning the data.

LGL and Stantec provided AECOM with the following documents which were used to produce this report:

2011
- An Excel spreadsheet summarizing field results entitled "*2011-2012 Herpetiles summary sheet.xlsx*";
- An Excel spreadsheet summarizing field results entitled "*TAB-2015-07-07-LGL_Herp_Observations_Workbook.xlsx*"; and
- An Excel spreadsheet summarizing field results entitled "*2011-2012_Herp_Observations_Workbook.xlsx*".

2012
- An Excel spreadsheet summarizing field results entitled "*2011-2012 Herpetiles summary sheet.xlsx*";
- An Excel spreadsheet summarizing field results entitled "*TAB-2015-07-07-LGL_Herp_Observations_Workbook.xlsx*";
- An Excel spreadsheet summarizing field results entitled "*2011-2012_Herp_Observations_Workbook.xlsx*";

2013
- Scanned handwritten field notes entitled "*60824_Amphibiancall.pdf*";
- Scanned handwritten field notes entitled "*60824_Reptile.pdf*";
- An Excel spreadsheet summarizing Species at Risk (SAR) observed entitled "*Significant species observations.xlsx*"; and
- An Excel spreadsheet indicating all survey locations entitled "*All survey locations_UTM_MC_07112013.xlsx*".

Copies of the above files are provided in **Appendix A**[1].

1. *Records of Species At Risk considered to be restricted are not being made public due to the threat of poaching experienced by these species. These records will be provided under a separate cover to the Ministry of Natural Resources and Forestry (MNRF) and / or Environment Canada – Canadian Wildlife Service (EC-CWS) for permitting purposes.*

2. Methods

2.1 Work Plan

The following sections provide a description of work plan methods written by LGL and Stantec for the various ***Herpetological Surveys***. These descriptions are taken directly from LGL's *Work plan for the Nigig Power Wind Farm Project Background Ecological Studies* (LGL, 2011a) and Stantec's *Terrestrial Survey Work Program* (Stantec, 2013), respectively.

Complete copies of LGL's *Work plan for the Nigig Power Wind Farm Project Background Ecological Studies* (LGL, 2011a) and Stantec's *Terrestrial Survey Work Program* (Stantec, 2013) are provided in **Appendix B**[2].

2.1.1 2011 and 2012 Herpetological Surveys (LGL, 2011a)

Ecological Receptor	*Recommended Studies*	*Timing*
Reptiles (SAR and non-SAR)	*Incidental observations confirm species and distribution within study area.* *Focused habitat identification within construction footprint of Project elements (e.g., road alignments, laydown and tower areas).* *General habitat identification (and avoidance) by ELC delineation of wetland communities as preliminary constraints.* *Desktop review of key reptile habitat (e.g., overwintering sites, nesting and incubation areas) and seasonal biology (e.g., timings of key life history elements) to inform spatial and temporal avoidance and mitigation strategies.*	*Incidental (spring, summer and fall)*
Amphibians (SAR and non-SAR)	*Incidental observations confirm species and distribution within study area.* *Focused habitat identification within construction footprint of Project elements (e.g., watercourse and wetland crossings).* *General habitat identification (and avoidance) by ELC delineation of wetland communities as preliminary constraints.* *Desktop review of key amphibian habitat (e.g., overwintering sites, breeding areas) and seasonal biology (e.g., overwintering, emergence, breeding) to inform spatial and temporal avoidance and mitigation strategies.*	*Incidental (spring, summer and fall)*

2.1.2 2013 Herpetological Surveys (Stantec, 2013)

*"**Western Chorus Frog and Salamanders (April):***
Western Chorus Frog surveys will consist of 3-minute call counts at potential breeding habitat conducted in April, during appropriate weather conditions. This species breeds in small or shallow aquatic habitats associated with moist, open terrestrial habitat (COSEWIC, 2008c). Males call from the water and are typically active when air temperatures are above 5° C, although calls have been detected at air temperatures as low as -1° C (COSEWIC, 2008c).

Unlike many anurans, Western Chorus Frogs are generally very active throughout the day. As such, daytime survey will be used to cover larger portions of the Study Area than evening call surveys would permit.

2. *Records of Species At Risk considered to be restricted are not being made public due to the threat of poaching experienced by these species. These records will be provided under a separate cover to the Ministry of Natural Resources and Forestry (MNRF) and / or Environment Canada – Canadian Wildlife Service (EC-CWS) for permitting purposes.*

Surveys for amphibian egg masses will take place concurrent with calling surveys. These will consist of perimeter surveys of suitable breeding ponds by trained field personnel. Egg masses of different species are often characteristic based on features such as where they are laid, how many eggs are in the mass, density of the egg mass, and whether or not the eggs are encased in jelly.

Reptile Habitat and Targeted Surveys (May and June):
Reptile habitat and targeted species surveys will take place in three stages.

Preliminary surveys for reptiles will also take place throughout the migratory and breeding bird survey periods. Field biologists familiar with reptile species identification will be conducting area searches and wandering transect surveys in a variety of areas providing habitat for reptiles at both the Project Location, weekly from early April until early July, and along the Transmission Line, weekly from late May until early July. Any incidental observations of turtles, snakes or lizards, including shed skins or shells, will be recorded on survey forms and used to refine the field survey program proposed for June.

Potential snake or turtle habitat within the Study Area will also be identified during Ecosite surveys, beginning in May. The habitat assessment will involve identification of potential reptile habitat features, including:

- *Turtle overwintering habitat and snake/skink hibernacula;*
- *Nesting sites; and,*
- *Foraging habitats.*

Targeted field surveys for reptile species at risk will occur in June. Timing of these surveys will coincide with a period of high activity for reptiles (nesting and foraging), but also when air temperatures encourage basking behaviour. Surveys for snake species at risk and Five-lined Skink will consist of wandering transects through all appropriate habitat types (Table 2-1).

Additional survey effort will be directed toward areas with previous observations of these species which may indicate high quality or limited habitat. To the extent possible, surveys will be conducted on sunny days when air temperatures are a minimum of 15°C (ideally 20°C). Surveys for turtles will consist of daytime basking surveys from land or boat in suitable wetland and open water habitat (Table 2-1), and evening nesting surveys in potential upland nesting sites identified during Ecosite surveys. Basking surveys will be conducted on sunny days when air temperatures are a minimum of 15°C (ideally 20°C). Nesting surveys will take place on warm evenings (daytime air temperature >20°C), ideally before or after rainfall. All surveys will record species, number, location and behaviour of observed reptiles.

The purpose of the targeted surveys is to confirm habitat used by the various reptile species at risk within the Study Area and provide information on general abundance and distribution. Survey results will be used to produce detailed mapping of reptile habitat features which will be used to guide the siting layout process and maximize avoidance of sensitive features.

Table 2-1: General Habitat Description and Use by Reptile Species at Risk

	Common Name	***General Habitat and Use****
Turtles	*Blanding's Turtle*	*Lakes, ponds and wetlands with clear shallow water and muck bottoms. Will move between habitats within active season; aerial basking; nesting in late May to early July, in open sandy soil up to 2.5 km from primary wetland, but typically within 400 m of water; overwinter in marsh, bog or fen with >0.5 m water depth.*
	Eastern Musk Turtle (Stinkpot)	*Shallow water in rivers, lakes and ponds with slow current and soft bottom; aquatic basking, often under floating vegetation; nesting in June, in shallow soil near water, occasionally in or under leaf litter; overwinter in primary habitat with muck bottom.*

	Common Name	General Habitat and Use*
	Northern Map Turtle	*Large rivers and lakes with soft bottom; aerial basking; nesting June and July in sandy soil; overwinter in general habitat in areas with >5 m water depth.*
	Snapping Turtle	*All aquatic habitats, but rarely in moving water, prefer large water bodies associated with marsh and/or swamp; aquatic basking*
Snakes and Lizard	*Eastern Hog-nosed Snake*	*Open forest and forest edges with sandy soil in proximity to water; egg-laying in late June and July in nests excavated in sandy soil, often under cover objects; hibernation in mammal burrows.*
	Eastern Foxsnake	*Georgian Bay populations inhabit rock barrens with sparse trees and shrubs in close proximity to shorelines; basking under or near rocks or in rock crevices; egg-laying late June to July in rock crevices or decaying vegetation; communal hibernation in rock crevices near shoreline.*
	Eastern Massasauga	*Georgian Bay populations use rock barrens, wetlands and shorelines; viviparous, bearing young in late summer; communal gestation under rock cover; hibernation in rock crevices or animal burrows where water level is close to surface.*
	Eastern Ribbonsnake	*Wetland edges with low vegetation and open basking areas; often seen swimming; viviparous, bearing young in late summer; hibernation in rock crevices and mammal burrows.*
	Eastern Milksnake	*Forest edges and open meadow; bask under cover objects; egg-laying May to July in loose soil, decomposing wood or vegetation; hibernation in rock crevices and mammal burrows, often communally and with other species.*
	Five-lined Skink	*Open forest and rock barren; abundance of cover objects (rocks and woody debris) is important, longer/larger cover is preferred; nesting in shallow soil under cover objects.*

*Note: * Habitat description and use data obtained from COSEWIC assessment and status reports."*

3. Results

3.1 Study Area

3.1.1 2011 and 2012

Incidental observations were recorded for reptiles and amphibians encountered by LGL Biologists during breeding bird surveys between May 1 and July 5, 2011 (LGL, 2011b). Refer to *Summary of 2011, 2012 and 2013 Breeding Bird Surveys – Henvey Inlet Wind Energy Centre* (AECOM, 2015) for additional information related to the locations of breeding bird survey conducted in 2011 and 2012. Specific locations of the herpetological surveys were not recorded, rather the location of reptiles observed was recorded. Therefore a defined study area for this work cannot be described; however, the locations of reptile Species at Risk observed through these surveys are presented in **Figure 3-1**.

Based on correspondence with Sarah Richer (a Biologist who conducted surveys on behalf of LGL in 2011 and 2012), surveys conducted by LGL within the HIWEC study area were primarily focused in the mosaic of wetlands and treed rock barrens in the central and western areas of the HIWEC study area, with less focus placed within the more heavily forested zones in the northeast and southeast portions of the HIWEC study area. Incidental observations of reptiles and amphibians were collected concurrently with other wildlife surveys.

3.1.2 2013

3.1.2.1 Western Chorus Frog and Salamanders

Based on the data provided, Western Chorus Frog (*Pseudacris triseriata*) and salamander surveys were completed at a total of 28 stations within the HIWEC study area in 2013. Two (2) survey stations were located near the shoreline of the Key River in the northwestern section of the HIWEC study area. Three (3) were located near the north shoreline of Henvey Inlet. Six (6) were located in the southwestern section of the HIWEC study area near Georgian Bay. A total of 12 were located near the southern shore of Henvey Inlet. Three (3) were located along Bekanon Road and two (2) were located near Highway 69. Refer to **Figure 3-2** for the locations of Western Chorus Frog and salamander survey stations.

3.1.2.2 Reptile Habitat and Targeted Surveys

The reptile habitat and targeted surveys which occurred within the HIWEC study area were conducted as wandering transects and area searches. Specific locations of the surveys were not recorded, rather the location of reptiles observed was recorded. Therefore a defined study area for this work cannot be described; however, the locations of reptile Species at Risk observed through these surveys are presented in **Figure 3-3**. Furthermore, four (4) reptile habitat and targeted surveys conducted by Stantec within their transmission line study area are within the HIWEC study area. These stations were located along the Highway 69 on the eastern limit of the HIWEC study area. Locations of reptile Species at Risk observed through these surveys are also presented in **Figure 3-3**.

3.2 Herpetological Survey Results

3.2.1 2011 and 2012

Locations of important reptile observations were recorded by LGL and provided to AECOM in an Excel file entitled *2011-2012 Herpetiles summary sheet.xlsx*. These observations are presented in **Appendix A**. UTM co-ordinates for observations recorded in this file were mapped by AECOM to confirm that these locations fall within the HIWEC study area. Only those observations that are located within the HIWEC study area are discussed in further detail below.

Based on the data provided, a total of 27 herpetofaunal species were recorded within the HIWEC study area in 2011 and 2012 (**Table 3-1**). These include five (5) federal Species at Risk (*i.e.*, species listed as Endangered or Threatened under Schedule 1 of the federal *Species at Risk Act*): Blanding's Turtle (*Emydoidea blandingii*), Eastern Musk Turtle (*Sternotherus odouratus*), Eastern Foxsnake (*Pantherophis gloydi*), Massasauga Rattlesnake (*Sistrurus catenatus*) and a restricted species. In addition, two (2) Species of Conservation Concern, Snapping Turtle and Five-lined Skink, were observed within the HIWEC study area in 2011 and / or 2012. The locations where these species were observed are shown on **Figure 3-1**. The locations of the restricted species observations are not being made public due to the threat of poaching experienced by this species.

Table 3-1: 2011 and 2012 Herpetofaunal Observations

Common Name	Scientific Name	Number of Individuals Observed	ESA Status[1]	SARA Status[2]	S-Rank[3]
Turtles (4 species)					
Blanding's Turtle	*Emydoidea blandingii*	74	Threatened	Threatened (Schedule 1)	S3
Eastern Musk Turtle	*Sternotherus odouratus*	1	Special Concern	Threatened (Schedule 1)	S3
Midland Painted Turtle	*Chrysemys picta marginata*	5	-	-	S4
Snapping Turtle	*Chelydra serpentina*	6	Special Concern	Special Concern (Schedule 1)	S3
Snakes and Lizards (9 species)					
Dekay's Brownsnake	*Storeria dekayi*	1	-	-	S5
Eastern Foxsnake	*Pantherophis gloydi*	1	Threatened	Endangered (Schedule 1)	S2
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	12	-	-	S5
Five-lined Skink	*Plestiodon fasciatus*	4	Special Concern	Special Concern (Schedule 1)	S3
Massasauga Rattlesnake	*Sistrurus catenatus*	21 (4 shed skins also recorded)	Threatened	Threatened (Schedule 1)	S3
Northern Watersnake	*Nerodia sipedon sipedon*	1	-	-	S5
Red-bellied Snake	*Storeria occipitomaculata*	3	-	-	S5
Ring-necked Snake	*Diadophis punctatus*	2	-	-	S4
Smooth Greensnake	*Opheodrys vernalis*	6	-	-	S4
Frogs (8 species)					
American Bullfrog	*Lithobates catesbeianus*	Not Recorded	-	-	S4
American Toad	*Anaxyrus americanus*	Not Recorded	-	-	S5
Gray Treefrog	*Hyla versicolor*	Not Recorded	-	-	S5
Green Frog	*Lithobates clamitans*	Not Recorded	-	-	S5
Mink Frog	*Lithobates septentrionalis*	Not Recorded	-	-	S5
Northern Leopard Frog	*Lithobates pipiens*	Not Recorded	-	-	S5
Spring Peeper	*Pseudacris crucifer*	Not Recorded	-	-	S5
Wood Frog	*Lithobates sylvaticus*	Not Recorded	-	-	S5

Common Name	Scientific Name	Number of Individuals Observed	ESA Status[1]	SARA Status[2]	S-Rank[3]
Salamanders and Newts (5 species)					
Spotted Salamander	*Ambystoma maculatum*	Not Recorded	-	-	S4
Blue-spotted Salamander	*Ambystoma laterale*	1	-	-	S4
Red-spotted Newt	*Notophthalmus viridescens viridescens*	1	-	-	S5
Eastern Red-backed Salamander	*Plethodon cinereus*	1	-	-	S5
Mole Salamander species	*Ambystoma* sp.	Not Recorded	-	-	-
Restricted Species (1 species)					

Notes:

1. ***ESA Status**: The Endangered Species Act 2007 (ESA) protects Species at Risk (Threatened and Endangered) at a Provincial Level.*
2. ***SARA Status:** The Species at Risk Act (SARA) protects Species at Risk (Special Concern, Threatened and Endangered) at a Federal Level. Species listed under Schedule 1 receive protection under SARA.*
3. ***S-rank:** The Natural Heritage provincial ranking system (provincial S-rank) is used by the MNRF Natural Heritage Information Centre (NHIC) to set protection priorities for rare species and natural communities. Definitions are as follows:*

S1	*Extremely rare in Ontario; usually 5 or fewer occurrences in the province or very few remaining individuals; often especially vulnerable to extirpation.*
S2	*Very rare in Ontario; usually between 5 and 20 occurrences in the province or with many individuals in fewer occurrences; often susceptible to extirpation.*
S3	*Rare to uncommon in Ontario; usually between 20 and 100 occurrences in the province; may have fewer occurrences, but with a large number of individuals in some populations; may be susceptible to large-scale disturbances. Most species with an S3 rank are assigned to the watch list, unless they have a relatively high global rank.*
S4	*Common and apparently secure in Ontario; usually with more than 100 occurrences in the province.*
S5	*Very common and demonstrably secure in Ontario.*
SH	*Possibly Extirpated (Historical). Species or community occurred historically in the nation or state/province, and there is some possibility that it may be rediscovered. Its presence may not have been verified in the past 20-40 years.*
S#S#	*A numeric range rank (e.g., S2S3) is used to indicate any range of uncertainty about the status of the species or community.*
S#?	*Rank uncertain.*

There were a total of 74 Blanding's Turtle observations throughout the HIWEC study area during the 2011 and 2012 field seasons (refer to **Figure 3-1** for locations). Based on correspondence with Sarah Richer (a Biologist who conducted surveys on behalf of LGL in 2011 and 2012), some individual turtles that were repeatedly observed in the same small water body in early May continued to be observed throughout the season into September. These individuals were observed in large and small wetlands (beaver ponds, marshes, fens, bogs and swamps), wet ditches and larger puddles along Bekanon Road, and some larger puddles amongst the treed rock barrens, as well as drier uplands. Individuals were observed travelling and foraging on upland treed rock barrens and the more densely forested habitat on the northeast and southeast portions of the HIWEC study area, including both on and adjacent to Bekanon Road. This species was also confirmed to be nesting on Bekanon Road.

The empty shell (both carapace and plastron) of one (1) Eastern Musk Turtle (*Sternotherus odouratus*) was observed within the HIWEC study area during the 2011 field season (**Figure 3-1**). Based on correspondence with Sarah Richer, it was found along the shoreline of the Key River and was estimated to be a 'winter kill' (one that did not survive hibernation) by the LGL Biologist who located it.

There were a total of six (6) Snapping Turtle observations within the HIWEC study area during the 2011 and 2012 field seasons (**Figure 3-1**). Based on correspondence with Sarah Richer, this species was also confirmed to be nesting on Bekanon Road.

One (1) adult Eastern Foxsnake was observed within the HIWEC study area during the 2011 and 2012 field seasons (**Figure 3-1**). This observation was made on the north side of Henvey Inlet, approximately 100 m inland from the Key River adjacent to a large wetland.

A total of four (4) Five-lined Skinks were observed within the HIWEC study area during the 2011 and 2012 field seasons (**Figure 3-1**). These observations were all made on the southern side of the HIWEC study area. Based on correspondence with Sarah Richer, each individual was observed in treed rock barrens with abundant cover objects adjacent to water sources.

There were a total of 21 Massasauga Rattlesnake observations (as well as four shed skins) within the HIWEC study area during the 2011 and 2012 field seasons (**Figure 3-1**). This total includes two (2) records of Massasauga Rattlesnakes observed killed by vehicles on Bekanon Road. Based on correspondence with Sarah Richer, these individuals were observed in large and small wetlands (beaver ponds, marshes, fens, bogs and swamps), and drier uplands, including the treed rock barrens and the more densely forested habitat on the northeast and southeast portions of the HIWEC study area and along Bekanon Road.

In addition, six (6) predated turtle nests were observed in the HIWEC study area. Based on correspondence with Sarah Richer, these nests were found primarily in sandy areas along the shoreline of Georgian Bay in Sandy Bay, and along the south shore of Henvey Inlet, as well as in areas with sandier soil exposed to the sun along Bekanon Road. The predated turtle eggshells observed included those with shapes indicative of Snapping Turtle and / or Northern Map Turtle, and Midland Painted Turtle and / or Blanding's Turtle.

Based on correspondence with Sarah Richer, several anecdotal reports of snakes with 'black bellies' exhibiting defensive behaviour diagnostic of the harmless Eastern Hog-nose Snake (including playing dead and flattening their neck to appear similar to a cobra) have been reported within the HIWEC study area by several band members, who locally refer to them as 'Puff Adders'. No other snake that occurs in Ontario exhibits this behaviour, which eliminates the chance that those band members are confusing the observed specimens with another snake. Biologists did not record this species during 2011 or 2012 surveys.

3.3 2013

3.3.1 Western Chorus Frog and Salamander Surveys

Locations of Western Chorus Frog and salamander survey stations were recorded by Stantec and provided to AECOM in an Excel file entitled *All survey locations_UTM_MC_07112013.xlsx*. These are presented in **Appendix A**. The UTM co-ordinates of survey stations were mapped by AECOM. Only the Western Chorus Frog and salamander survey stations that fall within the HIWEC study area are discussed in further detail below (refer to **Figure 3-2**).

Based on the data provided, some of the surveys were conducted on April 22 and 30, 2013 while the remaining surveys were conducted on May 7 and 8, 2013. The majority of amphibian surveys were conducted during the day; while some occurred at night and a small number occurred at an unspecified time. A total of 17 stations (61%) were surveyed during the day, six (6; 21%) were conducted night, and five (5; 18%) occurred at an unspecified time. **Table 3-2** provides a summary of which station received day, night or unspecified time surveys.

Salamander egg mass surveys were completed in conjunction with the Western Chorus Frog surveys; however, the results of these surveys were not indicated on the field notes provided by Stantec. On February 26, 2015, Stantec provided confirmation that these surveys were completed.

Table 3-2: Summary of Day and Night 2013 Western Chorus Frog Surveys

Survey Time	Stations	Total
Day	6, 11 to 17, 129 to 137	17
Night	1 to 5, 126	6
Unspecified	7 to 10, 127	5
Total		**28**

The results of the Western Chorus Frog and salamander surveys are summarized in **Table C-1** in **Appendix C**. This table includes the dates, survey start and end times, weather conditions and results of each survey, wherever recorded, based on the field notes provided (refer to **Appendix A**).

Based on the data provided, a total of five (5) amphibian species were recorded within the HIWEC study area during these surveys, including American Toad (*Anaxyrus americanus*), American Bullfrog (*Lithobates catesbeianus*), Gray Treefrog (*Hyla versicolor*), Northern Leopard Frog (*Lithobates pipiens*) and Spring Peeper (*Pseudacris crucifer*). Two choruses of Spring Peepers were heard calling from stations 126 and 127, respectively. No egg masses were observed.

In addition, one (1) Western Chorus Frog (*Pseudacris triseriata*), was possibly heard calling from station 127; however, Stantec was not able to confirm this species identification. The Great Lakes / St. Lawrence – Canadian Shield Population of Western Chorus Frog is listed as Threatened under Schedule 1 of the federal *Species at Risk Act*. Because this observation was not confirmed, this species has not been included in the tally of amphibians recorded above.

3.3.2 Reptile Habitat and Targeted Surveys

The field notes regarding reptile habitat and targeted surveys for the HIWEC study area as provided by Stantec in the document entitled *60824_Reptile.pdf* includes reptile observations made within both the HIWEC study area and along the proposed transmission lines. When a reptile was observed during wandering transect surveys or area searches, the following information was collected: location of observation, species, habitat description and notes. The location of surveys, start and end point of transects, and duration of surveys was not recorded in the field notes in the document entitled *60824_Reptile.pdf*. Therefore, the results of these surveys are presented as observations of reptiles within the HIWEC study area and are summarized in **Section 3.3.3** below.

Based on the data provided, no field studies targeting snake, lizard or turtle Species at Risk, or nesting and basking surveys, as described in the work plan (Stantec, 2013), were conducted within the HIWEC study area. However, four (4) reptile habitat and targeted surveys conducted by Stantec within their transmission line study area are within the HIWEC study area. Species at Risk recorded through these surveys are summarized in **Section 3.3.3** below. Please refer to the *Summary of 2013 Herpetological Surveys – Route A and Route B Transmission Line Study Areas* (AECOM, 2015b) for further details regarding survey methods and approach.

3.3.3 Important Herpetofaunal Observations

Locations of important herpetofaunal observations were recorded by Stantec and provided to AECOM in an Excel file entitled *Significant Species Observations.xlsx* and for those stations formerly on the transmission line which are now with the HIWEC study area in a pdf entitled *60824_Reptile.pdf*. UTM co-ordinates for observations recorded in the “Reptiles Henvey Inlet” and “Reptiles MTO Corridor” tabs of the Excel file entitled *Significant Species Observations.xlsx* and in *60824_Reptile.pdf* for those stations which were located within the HIWEC study area were mapped by AECOM to confirm that these locations fall within the HIWEC study area (**Figure 3-3**). Only the important herpetofaunal observations that are located within or in the vicinity of the HIWEC study area are discussed in further detail below.

Important herpetofaunal observations were recorded within or in the vicinity of the HIWEC study area between April 22 and September 23, 2013. These observations are presented in **Appendix A**. The following table (**Table 3-3**) provides a summary of the important herpetofaunal species observed within the HIWEC study area in 2013. These include four (4) Federal Species at Risk (*i.e.*, species listed as Endangered or Threatened under Schedule 1 of the federal *Species at Risk Act*): Blanding’s Turtle, Eastern Foxsnake, Massasauga Rattlesnake and a restricted

species. In addition, two (2) Species of Conservation Concern, Snapping Turtle and Five-lined Skink, were recorded in the HIWEC study area in 2013. The locations where these species were recorded are shown on **Figure 3-3**. The locations of the restricted species observations are not being made public due to the threat of poaching experienced by this species.

Table 3-3: 2013 Important Herpetofaunal Observations

Common Name	Scientific Name	Number of Individuals Observed	ESA Status[1]	SARA Status[2]	S-Rank[3]
Turtles (2 species)					
Blanding's Turtle	*Emydoidea blandingii*	82	Threatened	Threatened (Schedule 1)	S4
Snapping Turtle	*Chelydra serpentina*	20	Special Concern	Special Concern (Schedule 1)	S3
Snakes and Lizards (4 species)					
Eastern Foxsnake	*Pantherophis gloydi*	1	Threatened	Endangered (Schedule 1)	S2
Five-lined Skink	*Plestiodon fasciatus*	8	Special Concern	Special Concern (Schedule 1)	S3
Massasauga Rattlesnake	*Sistrurus catenatus*	26	Threatened	Threatened (Schedule 1)	S3
Milksnake	*Lampropeltis triangulum*	3	Special Concern	Special Concern (Schedule 1)	S3
Restricted Species (1 species)					

Notes:

1. ***ESA Status**: The Endangered Species Act 2007 (ESA) protects Species at Risk (Threatened and Endangered) at a Provincial Level.*
2. ***SARA Status:** The Species at Risk Act (SARA) protects Species at Risk (Special Concern, Threatened and Endangered) at a Federal Level. Species listed under Schedule 1 receive protection under SARA.*
3. ***S-rank:** The natural heritage provincial ranking system (provincial S-rank) is used by the MNRF Natural Heritage Information Centre (NHIC) to set protection priorities for rare species and natural communities. Definitions are as follows:*
   - *S1 Extremely rare in Ontario; usually 5 or fewer occurrences in the province or very few remaining individuals; often especially vulnerable to extirpation.*
   - *S2 Very rare in Ontario; usually between 5 and 20 occurrences in the province or with many individuals in fewer occurrences; often susceptible to extirpation.*
   - *S3 Rare to uncommon in Ontario; usually between 20 and 100 occurrences in the province; may have fewer occurrences, but with a large number of individuals in some populations; may be susceptible to large-scale disturbances. Most species with an S3 rank are assigned to the watch list, unless they have a relatively high global rank.*
   - *S4 Common and apparently secure in Ontario; usually with more than 100 occurrences in the province.*
   - *S5 Very common and demonstrably secure in Ontario.*
   - *SH Possibly Extirpated (Historical). Species or community occurred historically in the nation or state/province, and there is some possibility that it may be rediscovered. Its presence may not have been verified in the past 20-40 years.*
   - *S#S# A numeric range rank (e.g., S2S3) is used to indicate any range of uncertainty about the status of the species or community.*
   - *S#? Rank uncertain.*

There were a total of 82 Blanding's Turtle observations at 52 locations within or in the vicinity of the HIWEC study area during the 2013 field season. Of these, 45 locations (UTM co-ordinates) were provided by Stantec (**Figure 3-3**). Observations of this species were widespread but most observations were made on the south side of Henvey Inlet.

There were a total of 20 Snapping Turtle observations within the HIWEC study area during the 2013 field season (**Figure 3-3**). Observations of this species were distributed across the HIWEC study area.

A single (1) Eastern Foxsnake was observed just outside the HIWEC study area during the 2013 field season (**Figure 3-3**). This observation was made on the coast of Georgian Bay and is not located adjacent to any proposed HIWEC infrastructure.

A total of eight (8) Five-lined Skinks were observed within the HIWEC study area during the 2013 field season (**Figure 3-3**). Observations of this species were generally south of Henvey Inlet, with the exception of two locations near Highway 69 north of Henvey Inlet.

There were a total of 26 Massasauga Rattlesnake observations within the HIWEC study area during the 2013 field season (**Figure 3-3**). Observations of this species were generally distributed across the HIWEC study area, with more observations on the north side of Henvey Inlet compared to the south side.

A total of three (3) Milksnakes were observed within the HIWEC study area during the 2013 field season (**Figure 3-3**). Observations of this species were limited to the north side of Henvey Inlet.

4. Summary

LGL conducted the following herpetological surveys in 2011 and 2012 within the HIWEC study area:

- Incidental observations were recorded for reptiles and amphibians encountered during the 2011 and 2012 field seasons. Specific locations of the herpetological surveys were not recorded; therefore, a defined study area for this work cannot be described. Rather, the locations of reptiles observed were recorded.
- A total of 27 herpetofaunal species were recorded within the HIWEC study area in 2011 and 2012, including five (5) federal Species at Risk (Blanding's Turtle, Eastern Musk Turtle, Eastern Foxsnake, Massasauga Rattlesnake and a restricted species) and two (2) species of conservation concern (Snapping Turtle and Five-lined Skink).

Stantec conducted the following herpetological surveys in 2013 within the HIWEC study area:

- Western Chorus Frog and salamander surveys were completed at 28 monitoring stations established in the HIWEC study area in 2013.
- A total of five (5) amphibian species were confirmed within the HIWEC study area. None of these are Species at Risk. However, one (1) Western Chorus Frog was possibly heard, although not confirmed, at monitoring station 127.
- Incidental observations were recorded for herpetofauna encountered during the 2013 field season. Specific locations of the herpetological surveys were not recorded; therefore, a defined study area for this work cannot be described. Rather, the locations of important reptiles observed were recorded.
- Four (4) federal Species at Risk (Blanding's Turtle, Eastern Foxsnake, Massasauga Rattlesnake and a restricted species) and two (2) species of conservation concern (Snapping Turtle and Five-lined Skink) were recorded in the HIWEC study area in 2013.

5. Assumptions and Clarification

The following are assumptions and clarifications made and/or required by AECOM based on the field notes provided by Stantec in October 2014:

- Based on the field notes provided in *60824_Amphibianscall.pdf*, it was unclear if amphibian (including salamander) egg mass surveys were completed in the HIWEC study area. On February 26, 2015, Stantec provided AECOM with comments that confirmed that these surveys were undertaken and that no egg masses were observed.
- It was unclear if reptile habitat surveys, targeted surveys for reptile Species at Risk, and turtle nesting and basking surveys were completed in 2013 based on the field notes provided by Stantec in October 2014. On February 26, 2015, Stantec provided AECOM with comments that confirmed that field studies targeting snake, lizard or turtle Species at Risk, or nesting and basking surveys, were not conducted.
- Eastern Newt (*Notophthalmus viridescens viridescens*) was recorded in the Excel spreadsheet entitled *2011-2012 Herpetiles summary sheet.xlsx*. The more commonly accepted common name for this species is Red-spotted Newt therefore it is included in this report as such.

*not all observations of the more common species were recorded, including those of Midland Painted Turtle and Eastern Gartersnake, and Mole Salamander sp (Ambystoma sp.) egg sacs
**no frog species were included on this sheet as they were too numerous; however, the following species were observed within the Henvey Inlet 2 lands:
American Toad, Green Frog, Northern Leopard Frog, American Bullfrog, Mink Frog, Wood Frog, Spring Peeper, and Gray Treefrog; anecdotal reports of Spotted Salamander were noted

Midland Painted Turtle	*Chrysemys picta marginata*	all sizes found throughout site, too many to report
Midland Painted Turtle	*Chrysemys picta marginata*	
Midland Painted Turtle	*Chrysemys picta marginata*	
Midland Painted Turtle	*Chrysemys picta marginata*	missing front right foot
Midland Painted Turtle	*Chrysemys picta marginata*	
Smooth Greensnake	*Opheodrys vernalis*	
Smooth Greensnake	*Opheodrys vernalis*	
Smooth Greensnake	*Opheodrys vernalis*	
Smooth Greensnake	*Opheodrys vernalis*	
Smooth Greensnake	*Opheodrys vernalis*	small, even for a green snake; last year's juvenile?
Smooth Greensnake	*Opheodrys vernalis*	discovered under our parked truck, with its body burned
Ring-necked Snake	*Diadophis punctatus*	
Ring-necked Snake	*Diadophis punctatus*	
Red-bellied Snake	*Storeria occipitomaculata*	quite fat along the length of its body; pregnant?
Red-bellied Snake	*Storeria occipitomaculata*	small, even for a redbelly; last year's juvenile?
Red-bellied Snake	*Storeria occipitomaculata*	
Dekay's Brownsnake	*Storeria dekayi*	smaller though not baby; last year's hatch?
Northern Watersnake	*Nerodia sipedon sipedon*	adult
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	adult
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	Adult; the stripe along the top of its body was more white than yellow, not used to seeing that, was quite pretty
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	headless; weasel kill?
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Gartersnake	*Thamnophis sirtalis sirtalis*	
Eastern Red-backed Salamander	*Plethodon cinereus*	red-backed phase
Blue-spotted Salamander	*Ambystoma laterale*	Quite small; maybe this year's morph?
Eastern Newt	*Notophthalmus viridescens viridescens*	Adult, in water at beaver dam

*not all observations of the more common species were recorded, including those of Midland Painted Tu
**no frog species were included on this sheet as they were too numerous; however, the following species
American Toad, Green Frog, Northern Leopard Frog, American Bullfrog, Mink Frog, Wood Frog, Spring F

Notes:

Some reptile observations could not be identified to species because of the condition of the specimen or evidence of the specimen found (i.e., hatched and/or predated e

ESA Status: The Endangered Species Act 2007 (ESA) protects Species at Risk (Threatened and Endangered) at a Provincial Level.

SARA Status: The Species at Risk Act (SARA) protects Species at Risk (Special Concern, Threatened and Endangered) at a Federal Level. Species listed under Scher

S-rank: The Natural Heritage provincial ranking system (provincial S-rank) is used by the MNRF Natural Heritage Information Centre (NHIC) to set protection priorities fo

Extremely rare in Ontario; usually 5 or fewer occurrences in the province or very few remaining individuals; often especially vulnerable to extirpation.

Very rare in Ontario; usually between 5 and 20 occurrences in the province or with many individuals in fewer occurrences; often susceptible to extirpation.

Rare to uncommon in Ontario; usually between 20 and 100 occurrences in the province; may have fewer occurrences, but with a large number of individuals in some

Common and apparently secure in Ontario; usually with more than 100 occurrences in the province.

Very common and demonstrably secure in Ontario.

Possibly Extirpated (Historical) - Species or community occurred historically in the nation or state/province, and there is some possibility that it may be rediscovered

S#S# A numeric range rank (e.g., S2S3) is used to indicate any range of uncertainty about the status of the species or community.

Rank uncertain.

Species Observations

Species of Conservation Concern		Secure Species		Unknown Species Nests	
■	Habitat	■	Habitat	■	Unknown Heron Nest(s)
●	Sighting	●	Sighting	■	Unknown Raptor Nest(s)

Habitat observations refer to specific habitat types.

For herptiles they are hibernaculum and gestation sites.

For birds and raptors they are nesting sites.

Data Sources - MNR NRVIS, Ecoplans Limited Fieldwork 2003, 2004, 2005

Species Observations Data Sources
Data source code noted after species code (ie EMRa)

Code	Data Source
a	MNR Observations
b	Ecoplans field work

Description of area searched (map attached):

Features found:

Species	Time	Evidence	(17T) UTM	Description and comments
Snapping Turtle	11:47am Apr 30 2013	OB photo taken	522773 5075058	adult, submerged in shallow water, inland marsh/pond
Blanding's Turtle	12:10 pm Apr 30 2013	photo taken OB	522671 5074966	adult, on land, approx 1m from water
Snapping Turtle	1:11 pm Apr 30/2013	photo taken OB	522443 5074984	adult, basking on log in large beaver pond
Blanding's Turtle	1:50pm Apr 30/2013	OB moved before pic was taken	522347 5075863	adult, in very small inland pool (size of a small house or shed)
Five-lined Skink	Apr 30 2013 2:00pm	OB photo taken	522468 5075992	adult female, basking
Blanding's Turtle	8:22am May 1 2013	OB photo taken	525556 5073401	adult, basking, inland small wetland
Blanding's Turtle nest	found May 2 7:00 am	OB, photo taken	529532 5078465	disturbed, on Beckanon Rd, sandy area; eggshells empty, still in ground - hatched?!
Blanding's Turtle	May 2 2013 3:30pm	OB, photo taken	532316 5078607	adult, basking
Blanding's Turtle	May 2 2013 4:46pm	OB, photo not taken	529450 5078037	adult, basking, moved before I could get a pic
[redacted]	May 3 2013 9:36am	OB, photo taken	[redacted]	male, basking, potentially beginning to travel overland
2 Snapping Turtles	May 3 2013 11:30am	OB, photo taken	523861 5081045	2 mating at water's surface
Smooth Green Snake	May 3 2013 11:18am	OB, photo taken	523819 5080864	crawled up into a juniper bush
[redacted]	May 3 am 2013 11:36	OB photo taken	[redacted]	adult female, basking
Blanding's Turtle	May 7, 2013 3:30 pm	OB, photo taken	529576 5078224	adult, basking on road Beckanon
Blanding's Turtle	May 8 2013 8:35am	OB, photo taken	523089 5076266	adult, swimming in shallow water nearshore
Massasauga Rattlesnake	10:31am May 9 2013	OB, photo taken	527183 5081709	in tall dry grassy floodplain area; very dull + dusty looking

Quality Control: This form is complete (__) & legible (__).

Signature: _____ (Field Personnel) Signature: _____ (Project Manager)

Species	Time	Evidence	UTM	Description and comments
Smooth Green Snake	1:08pm May 9 2013	OB, photo taken, dead	529498 5077982	dead on Beckanon Road
MASN Massasauga Rattlesnake	12:13pm May 14 2013	OB, photo taken	525263 5075698	coiled, resting; it is quite cool, approx 7°C, came across it accidentally
Massasauga Rattlesnake	May 15 2013 12:06pm	OB, [redacted] photo taken	526936 5077230	juvenile, [redacted] basking
BLTU Blanding's Turtle	May 15 2013 1:25	CA, OB, photo taken	532379 5078851	juvenile or sub adult; dead, some flesh (head, feet) still p
SNTU Snapping Turtle	May 16 2013 9:00am	OB, photo not taken	524895 5080998	adult, basking on log
MASN	May 16 2013 10:06am	OB, picture	527032 5081612	adult, alder thicket a grassy floodplain area
MASN	May 16 2013 10:26am	OB, picture	526870 5081680	adult, grassy floodplain
MASN	May 24 2013 10:47am	OB, picture	525143 5077208	adult, basking in lichen/rock/mossy barrens
BLTU	May 24 2012 11:25am	OB, no picture	525017 5076721	adult, moved from mainland into inlet, too fast to take a pic
SNTU	May 24 2013 4:33pm	OB, no picture	566913 5033340	adult, rescued off of highway + released into nearby wetland
BLTU	May 25 2013 8:41am	OB, photo taken	524965 5081001	adult, basking in pond with other BLTUs
MASN	May 30 2013 8:57am	OB, no photo	523790 5080884	moved too quick for photo; yearling, very tiny
MASN	May 30 2013 9:14am	OB, photo	523777 5081083	adult, the fattest I've ever seen; maybe gravid female?
2 BLTUs	May 30 2013 10:55am	OB, photo taken	524943 5081008	adults (two) basking on same log
BLTU	May 30 2013, 10:58	OB, no photo	524955 5081008	adult, basking on grassy [redacted] hummock/tuft
2 BLTUs	May 30 2013 10:59	OB, no photo	524929 5081034	adults, basking on a log
2 BLTUs	May 30 2013 11:07	OB, no photo	524936 5081023	adults, basking far away on log, distinctive shell shape
BLTU	[redacted] May 30 2012, 11:37am	OB, no photo	523994 5081431	adult, moving from mainland into the Key River too quick for pic
BLTU	June 4 pm 2013 3:07	OB, too far for photo	532783 5080227	adult basking on log in large wetland-pit
BLTU	June 5 2013 12:15pm	OB, photo taken	523169 5076383	basking on rock island at edge of water/inlet

Significant Observation Form

Project Number 160960824 Project Name: Nigig/Henvey Inlet

Date: October 8-11 2013 Field Personnel: S Richer & C Paterson

Weather Conditions:	Temp:	Wind:	Cloud:	PPT:	PPT in last 24 hrs:

Description of area searched (map attached):

Features found:

The 8 Bald Eagles recorded below do not include those observed during the hawk watch

Species	Time	Evidence	UTM	Description and comments
Bald Eagle	7:50am Oct 8 2013	observed by Sarah Richer & Carolyn Paterson	521312 5076396	flying at & below blade height, southeast, adult
Bald Eagle	10:00 Oct 8 2013	observed by Sarah Richer & Carolyn Paterson	525157 5078735	perched in White Pine on north shore briefly, then flew west, 4th year bird
Bald Eagle	7:40am Oct 10 2013	"	524574 5076114	3rd year bird, perched in Milltonk Bay after being observed flying at & below blade height
Bald Eagle	11:15 Oct 10 2013	"	526628 5081767	2nd year bird, flying west along inlet below blade height
Monarch (one individual)	10:53am Oct 11 2013	obs by Sarah Richer	522612 5077011	flying south; winds today ~5-10km/hr from NE

JULY 2011
LGL PROJECT TA8027

TABLE OF CONTENTS

1.0 INTRODUCTION

In 2011, the Nigig Power Corporation received approval under Ontario's Feed-In- Tariff (FIT) Program to construct a Wind Power Project at Henvey Inlet on Georgian Bay in the province of Ontario (Figure 1). With a total proposed rating of 300MW, the Nigig Power Wind Farm Project is the largest wind power project FIT contract awarded in Ontario. The expected Commercial Operation Date (COD) is February 2014. The Project study area encompasses the Reserve Lands of approximately 80 square kilometres (Figure 2). The major components of the Project, including all of the Project's wind turbines, are proposed to be located on Henvey Inlet First Nation Reserve No. 2 (Reserve No. 2). A transmission line that is part of the Project will be located off of Reserve No. 2 and a transformer station may be located off reserve in order to enable an interconnection with the Hydro One Transmission System. Vehicular access is limited to the unpaved Bekanon Road, which leads to a boat ramp in the eastern end of the Inlet. The remainder of the study area is accessible only by boat during the open water season and, to some extent, by snowmobile during the winter.

The study area consists of rocky outcrops that form shallow, longitudinal ridges, oriented in a northwest to the southeast direction. Intervening pockets of wetlands, alder thickets, poplar and jack pine stands make up the balance of the site. Topographic relief decreases from the east to west direction with elevations ranging from a high of 216m at the eastern portions near Highway 69 to a low of 168m at the western shoreline at Georgian Bay.

2.0 WORK PLAN OVERVIEW

The background ecological studies were developed to address pathways of effect between the Project and the natural heritage resources that are known to occur in the study area and surrounding region. The study area is large and, given its location on the Georgian Bay shore, it may include migratory routes of birds and bats. Interaction with migratory species is considered to be of primary importance, as it has the potential to profoundly affect Project design, extent and operational strategies to effectively mitigate harm. As such, the background ecological studies include considerable focus on migratory studies.

On the ground, development of the Project will involve watercourse and wetland crossings, and the construction of access roads, overhead electrical collector lines and turbines that may displace some terrestrial habitat. There is considerable scope for identification and avoidance of sensitive habitats and implementation of effective and proven mitigation strategies where limited intrusion is unavoidable. The baseline ecological studies include elements of desktop and on-site evaluation that are tailored to the various wildlife groups based on their habitats and habits.

The documented effects of wind power projects have been largely focused on impacts to migrating and resident birds and bats. Accordingly, wind farms should be located, designed and managed so that there are no significant adverse impacts on seasonal migrants, including those species that are of acknowledged national and international importance, or their habitats. In terms of the location of the project study area, the major physiographic features include the Georgian Bay coastline and Henvey Inlet, which may be used to some degree as migratory pathways by birds and bats. Of secondary concern are the terrestrial and aquatic flora and fauna, which are affected largely by the location of specific Project components in and around their habitats. The following potential effects have been documented in literature with respect to development of wind farms:

- Collision with the moving turbine blades, with the turbine tower or associated infrastructure such as overhead power lines, or the wake behind the rotors causing injury, leading to direct mortality to migrating birds and bats;
- Disturbance or displacement from around the turbines or exclusion from the whole wind farm. Reduced reproductive success or reduced survival may result if birds are displaced from preferred habitat and are unable to find suitable alternatives;
- Barriers to movement disrupting ecological links between feeding, wintering, breeding and moulting areas and extended flights around wind clusters; and,
- Change to or loss of habitat due to wind turbines and associated infrastructure.

As part of effective planning, there is a need to identify migratory pathways and patterns in terms of level of activity across the study area throughout the migratory seasons. This information may be used to identify sensitive areas, seasons and weather conditions that can be used to guide design of the Project extent and operation. In addition, migratory stopover, breeding bird and acoustic bat surveys are being used to understand distribution of birds and bats that use on-site habitats and may therefore be affected by the Project.

With respect to birds and bats, the following guidance documents have influenced and guided the ongoing evaluation of the ecological baseline:

- Ontario Ministry of Natural Resources (2010) Birds and Bird Habitats: Guidelines for Wind Power Projects;
- Ontario Ministry of Natural Resources (2010) Bats and Bat Habitats: Guidelines for Wind Power Projects;
- Environment Canada and Canadian Wildlife Service (2007) Recommended Protocols for Monitoring Wind Impacts of Wind Turbines on Birds; and,
- Environment Canada and Canadian Wildlife Service (2007) Wind Turbines and Birds, A Guidance Document for Environmental Assessment.

It should be noted that the Province has no regulatory jurisdiction over the Henvey Inlet Reserve #2 lands and therefore the above noted MNR documents are being used for reference only.

With respect to resident plants and wildlife, and their habitats, specific approaches have been developed in relation to the known factors of habitat association, life history parameters and Project interactions. Existing ecological information, ranging from large-scale forest resource inventories to studies of specific reptile SAR, is available for the region surrounding the Study Area. This includes data collected in the Highway 400 corridor and within the several large parks on Georgian Bay. Much can be inferred from this information regarding the occurrence, distribution, habitats and habits of wildlife species in the Study Area. This will form the basis of effective mitigation strategies to reduce the interaction of plants and wildlife with the Project.

Table 1, below, summarizes the ecological receptors, pathways of effect and corresponding study approaches recommended, and currently underway, for the Nigig Power Wind Farm Project.

Table 1: Summary of Ecological Receptors, Pathways of Effect and Ecological Baseline Studies for the Nigig Power Wind Farm Project

Ecological Receptor	Effects Pathways	Recommended Studies	Timing
Birds and Bats (SAR and non-SAR birds) (non-SAR bats only)	Collision with turbines (migratory and resident/seasonal). Habitat loss (migratory stopover and resident/seasonal).	Visual/IR-assisted studies of spring and fall bird/bat migration across the study area, using Henvey Inlet as an east-west transect. Migratory stopover surveys include boat-based and aerial surveys of waterfowl, hawk-watch stations and terrestrial routes for other species. Breeding bird surveys using point-count survey protocol at sites distributed throughout the study area (spring and summer). Aerial surveys to investigate possible colonial waterbird, heron and raptor nesting sites. Acoustic detection of resident bats using automated Wildlife Acoustics SM2BAT detectors at sites distributed throughout the study area (spring/summer).	Migration (May 2011; Aug-Oct 2011; Mar-May 2012) Breeding birds (Jun-Jul 2011; May-Jun 2012) Bat Acoustic (Jun-Jul 2011; Jun-Jul 2012, if warranted following review of 2011 data)

Ecological Receptor	Effects Pathways	Recommended Studies	Timing
Game/furbearers (non-SAR only)	Habitat loss. Road effects (disturbance, hunting, predation, roadkill).	Incidental observations confirm species and distribution within study area. Traditional knowledge and cultural value of wildlife species and their habitats. Aerial observations (moose/deer winter yards, wildlife trails). Desktop and field confirmation of key wildlife habitat (e.g., wetland, stands of mature trees, etc.) and seasonal biology.	Incidental (year round) Traditional (summer/fall/winter 2011) Aerial (winter 2011)
Reptiles (SAR and non-SAR)	Direct mortality during site preparation. Habitat loss. Road effects during operation (disturbance, roadkill).	Incidental observations confirm species and distribution within study area. Focused habitat identification within construction footprint of Project elements (e.g., road alignments, laydown and tower areas). General habitat identification (and avoidance) by ELC delineation of wetland communities as preliminary constraints. Desktop review of key reptile habitat (e.g., overwintering sites, nesting and incubation areas) and seasonal biology (e.g., timings of key life history elements) to inform spatial and temporal avoidance and mitigation strategies.	Incidental (spring, summer and fall) Mitigation methods will be developed and focused habitat ID and implementation of avoidance/mitigation will occur during design, pre-construction and construction phases.
Amphibians (SAR and non-SAR)	Direct mortality during site preparation (watercourse & wetland crossings). Habitat loss. Sedimentation and erosion effects on aquatic and wetland habitats of amphibians. Road effects during operation (roadkill).	Incidental observations confirm species and distribution within study area. Focused habitat identification within construction footprint of Project elements (e.g., watercourse and wetland crossings). General habitat identification (and avoidance) by ELC delineation of wetland communities as preliminary constraints. Desktop review of key amphibian habitat (e.g., overwintering sites, breeding areas) and seasonal biology (e.g., overwintering, emergence, breeding) to inform spatial and temporal avoidance and mitigation strategies.	Incidental (spring, summer and fall) Mitigation methods will be developed and focused habitat ID and implementation of avoidance/mitigation will occur during design, pre-construction and construction phases.

Ecological Receptor	Effects Pathways	Recommended Studies	Timing
Fish (non-SAR only)	Harmful alteration, disruption, destruction (HADD) of fish habitat at watercourse crossings (minor tributaries only). Sedimentation and erosion during construction and operations.	Focused fish habitat and fish community assessments within construction footprints (e.g., at watercourse crossings). Includes descriptions of physical habitat features (channel form, depth, flow, substrates, migration barriers, etc.), aquatic and riparian plant communities and fish community. Data to support selection of appropriate temporal, spatial and physical mitigation measures to minimize effects on fish habitat.	Incidental (spring, summer, fall) Focused assessment of watercourse crossings will be undertaken at design/permitting stage to support application to DFO for Fisheries Act Authorization if HADD to occur
Plants (SAR and non-SAR)	Direct loss/mortality of vegetation in cleared areas. Loss of vegetation communities during construction. Native plants may be used in traditional native medicine.	Desktop delineation of vegetation communities (aerial image interpretation; Forest Resource Inventory mapping). Supports assessment of effects on plants and basis for wildlife habitat assessment. Identification of wetlands and SAR plants as preliminary constraints. Focused assessment, including confirmation of significant species, within construction footprints. Traditional knowledge and cultural value of wild plant species and their habitats. Aerial and ground-based confirmation of valued vegetation communities (e.g., large stands of white pine, wetlands).	Field observations and confirmation of SAR, etc. (spring, summer, fall) Traditional (summer, fall 2011) Focused vegetation assessments may be required at design and pre-construction phases to confirm SAR or significant plants or plant communities

3.0 ECOLOGICAL STUDY APPROACH

The ecological baseline study approach has been designed to determine site sensitivity to the Project through a broad landscape-scale analysis using known ecological data and life history information, supplemented by new data collected within the study area. Sensitive areas will be identified as preliminary constraints on the basis of such criteria as habitat features, vegetation community, wildlife distribution and migratory patterns. Areas of lower sensitivity will emerge as preliminary opportunities for Project footprint, including access roads, transmission lines and turbine sites. Fine tuning of the layout and configuration will involve focused wildlife habitat identification and avoidance, particularly for Species-at-Risk and plants and wildlife that have traditional cultural significance. These approaches allow for the parallel collection of seasonally dependent ecological information about the site, as well as allow for the design and development of the Wind Power Project within the FIT Program timelines. Consultation with the Responsible Authority is a key component of the work plan and will be initiated early in the process to facilitate and incorporate meaningful feedback.

3.1 PRELIMINARY INFORMATION ACQUISITION AND DESKTOP REVIEW

Initial tasks of the baseline ecological studies were focused on compiling, reviewing and manipulating aerial and satellite imagery and forest/ecological mapping available for the study area. Due to the isolation of the site and lack of established transportation routes within the study area, much of the data available for use in this study include studies that were initiated by HIFN to serve their needs and remote sensing information. Work plan components for preliminary information acquisition include:

- Identification of regional natural heritage features;
- Assessment of landscape component features;
- Forest Resource Inventory Mapping and Ecological Lands Mapping;
- Database query on all known records of birds, bats, and SAR from local band, other studies conducted in the vicinity of the project site, local agency, naturalist and Bird Studies Canada, and other expert records; and
- A literature review of relevant plant and wildlife species studies, conservation objectives and issues related to the pathways of effect identified for the Project.

Assessment of landscape components utilized the following satellite imagery sources:

- FRI aerial photo ortho-images;
- Geoeye-1 new satellite images (0.5 m pixel);
- IKONOS archived satellite images (1 m pixel);
- FRI classification mapping;
- FRI Colour Infrared images; and,
- FRI DEM.

The imagery listed above was used to identify and map discrete units of habitat and cover, and these are among the primary constraints to the wind farm layout. Raw satellite imagery (Figure 2) and Forest Resource Inventory (FRI) mapping (Figure 3) and its associated layers are used to obtain other information regarding the topography and terrain associated with the site and was used to classify data into Ecological Lands Classification (ELC) Units. The ELC is used to delineate areas of landscape for sensitivity analysis based on vegetation community types and habitat associations for wildlife species and communities.

At present, the focus of the ELC-based analysis is identification and delineation of wetland units throughout the study area. The ELC analysis has been based on satellite and air photo images, supplemented by ground-truth surveys by the project botanist through reconnaissance of the study area by fixed wing aircraft, boat and pedestrian surveys. This has provided a preliminary constraint layer for the study area, as there are numerous ecological, engineering and economic justifications for avoiding intrusion of Project elements into wetlands. Specifically, minimizing intrusion into and crossing of wetland areas is a key mitigation strategy to limit Project effects on sensitive plant communities, potential SAR plants, fish and fish habitat, key amphibian habitats including breeding, nursery and overwintering areas, key reptile habitats including overwintering sites of SAR turtles and snakes and important breeding and feeding habitat for many other wildlife species.

3.2 FIELD INVESTIGATIONS

Screening level information will be obtained for the identification of major constraint areas, such as hibernaculae of bats and reptiles, major flyway corridors, waterfowl congregation areas, major wetlands, and areas of high quality vegetation communities (unique habitats such as fens, bogs, seepage zones, sand barrens, alvars) which have the potential for rare plants; and forested areas with high affinity for breeding birds and other wildlife. Once the major constraint areas are identified, it is anticipated that the information can be used to plan project components away from these zones. As constraints and Project design are considered in an iterative fashion, focused confirmation of plant and wildlife habitat, species and community characteristics will be undertaken on a site-specific basis within the project study area to support avoidance, mitigation and restoration strategies.

Because of the timeline associated with this project, preliminary field work collection was recommended to ensure that seasonally dependent data is collected in a timely manner to allow for fine tuning of the wind turbine layout. Biological fieldwork commenced in late April 2011 through reconnaissance investigations of the site and field observations of spring migratory birds, breeding birds, and bats. Incidental observations for other species and habitat features were also collected at that time.

3.2.1 Avian Surveys

Avian surveys have been targeted for migratory and breeding birds, as detailed in the following sections. The sections are separated by breeding bird consideration and field approach, and the migratory birds and field approach.

3.2.1.1 Breeding Bird Survey Considerations

- **Waterfowl –** breeding waterfowl are not expected to be abundant, however could be present in wetlands or small lakes and ponds.
- **Raptors –** breeding raptors may be at increased risk of collision with turbines because they tend to fly high and traverse the area repeatedly on a daily basis.
- **Colonial Waterbirds –** nesting colonies of species such as Double-crested Cormorant, Great Blue Heron, Black-crowned Night-Heron, gulls and terns may be present in the study area, and if so could be a concern depending on their location relative to the Project.
- **Passerines –** although not expected to be at great risk of mortality from turbines, habitat of breeding passerines could be affected by the Project. At this point, field studies have focused on covering the study area well and covering representative habitats to obtain a landscape-level understanding of breeding bird community and distribution.

3.2.1.2 Field Study Approach to Breeding Birds

- **Waterfow**l – incidental observations were made by field staff while in the study area during the 2011 breeding bird season.
- **Raptors** – An aerial survey was flown on June 9th to search for large nests (herons, hawks and eagles). Territories for more secretive species may be detected during breeding bird point counts (see below) or incidentally.
- **Colonial Waterbirds** – Aerial survey conducted to discover nesting colonies of Great Blue Heron. Gull and tern colonies will be investigated by a coastal survey conducted by boat, as well as observations from the air.
- **Passerine**s – Point counts and incidental observations will be used as the effective means for developing a species list for the site. Point counts followed EC guidelines, and will be used for the purpose of contributing to existing knowledge of the use of the site by birds during the breeding season, and to facilitate comparisons with the post-construction breeding bird community. Surveys were undertaken twice during the breeding season. Points were placed in representative habitats and distributed across the landscape to capture any habitat gradient which may be present across the study area.

Monitored Species / Behaviour	Sampling Method	Timing and Frequency
Waterfowl	Incidental observations from ground and aerial surveys	Throughout breeding season
Raptors	Aerial survey for large stick nests (Bald Eagle, Osprey), incidental observations.	Breeding season
Colonial Waterbirds	Aerial survey for heron nests, boat-based surveys of outer islands for other species	Breeding season
Passerines	A series of point counts established across the study area	Each point surveyed twice between May 30 and July 7, at least 10 days apart

3.2.1.3 Migratory Bird Considerations

- **Waterfowl** – migrating waterfowl may use Henvey Inlet or inlets to the north or south as stopover areas and this potential needs to be verified by field observations. Of particular concern would be overland flights by migratory waterfowl between Henvey Inlet and inlets to the north or south.
- **Raptors** – migrating raptors typically follow shorelines of Great Lakes. Field investigations will need to determine the magnitude of raptor migration through the site and where it is concentrated.
- **Passerines (nocturnal migrants**) – the majority of passerines migrate at night, at altitudes from close to ground level to well over 1 km. They are at risk of collision with towers and with the turbines, with an increased risk by lighting on the towers. Field investigations will need to determine the magnitude and altitude of nocturnal migrants across the study area. Nocturnal passerine migration generally occurs along a broad front, and flight altitude is largely determined by weather, however local features such as ridges or valleys may concentrate the number of migrants exposed to risk. Fortunately, the study area is characterized by relatively low relief.
- **Passerines (stopover sites)** – migration is energetically demanding for passerines and they require stopover habitat to feed and rest before continuing with migration. Habitat destruction in stopover areas is thought to be a primary cause of decline in migratory birds. This may not be as much of a concern for this project since the habitat in the surrounding area is fairly intact and the Project footprint would disturb only a small percentage of available natural habitat within the study area. However, shorelines can concentrate migrants so field investigations need to determine whether some areas are particularly important stopover sites.

3.2.1.4 Proposed Field Study Approach to Migratory Birds

- **Waterfow**l – visual monitoring, including passive IR camera techniques, and aerial observation surveys using fixed wing aircraft will be used to determine the magnitude and extent of waterfowl migration. These techniques will be employed at the site during the Fall Migration period in 2011 and Spring Migration in 2012.
- **Raptors** – raptor observation posts have been established in three locations along the Inlet. Regular visual watches during spring and fall migration are a straightforward method to determine magnitude of use and species involved. Diurnally migrating passerines such as Blue Jays and blackbirds will also be observed by this method.
- **Passerines (nocturnal migrants)** – visual and passive IR surveys will be used to monitor the movement of passerines during the Fall Migration period in 2011 and Spring Migration in 2012. The survey will utilize a number of locations situated along an east-west transect, accessible by boat along Henvey Inlet.

- **Passerines (stopover sites)** – regular stopover counts will be undertaken along a series of transects which will be surveyed weekly during the migration period. All birds encountered will be recorded (species & number).

Monitored Species / Behaviour	Sampling Method	Timing and Frequency
Waterfowl	Fixed wing aerial surveys of the study area and the immediately surrounding region	3 aerial surveys of region spaced throughout the migration period
Raptors and Diurnal Migrants	Standardized watches from 3 sites along the inlet.	September & October; 3 to 4 days per week
Nocturnal Migrants	Thermal infrared camera will be used to observe nocturnal migrants. A number of acoustic monitoring units will be spaced along the inlet to record night migrating birds.	IR – 2 weeks in September Acoustic – September to October
Stopover sites (passerines)	A series of transects will be set up across the study area and surveyed weekly for migrants	Mid August to October; 2 to 3 times per week

3.2.2 Bat Surveys

A screening level survey will be implemented in 2011 to determine the level of use of the site by bats, to identify significant habitat, and important habitat features or high use areas in the project area. Acoustic monitors were deployed in June and July 2011. The results of the 2011 acoustic monitoring will be reviewed to determine if additional monitoring is warranted perhaps in a more focused assessment based on initial data analysis and emerging Project layout.

3.2.2.1 Acoustic Monitoring of Bats

GENIVAR and LGL have initiated preliminary acoustic monitoring in June and July 2011 to attempt to identify the relative levels of bat activity across the study area during the late spring and early summer. These surveys are not focused on any anticipated turbine layout, but were intended to achieve broad geographical coverage of the study area, utilizing the established breeding bird routes for logistical efficiency. This preliminary data will contribute to a landscape-level understanding of bat distribution throughout the study area. The work plan includes:

- Deployment of 10 automatic acoustic monitors (Wildlife Acoustics SM2BAT units) at sites throughout the study area;
- Deployment and retrieval along or adjacent to existing breeding bird study routes for logistical efficiency;
- Shifting monitors to a number of locations to increase coverage; and,
- Incidental observations of bats during field surveys.

3.2.2.2 Bat Migration Monitoring

Bat migration will be investigated concurrently with bird migration with the use of visual observations augmented by the use of passive IR camera. The fall migratory study period from August to October is intended to capture peak bat activity in August.

3.2.3 Wildlife Habitat, Fish Habitat, and Species-at-Risk

Unlike other wind farm projects where the majority of wind turbine components will be situated in remnant agricultural lands, the Nigig Power Wind Farm Project will be situated in relatively undisturbed lands. Accordingly, it can be assumed that the ultimate wind farm location will be within an area already occupied by native flora and fauna, including several SAR. Blanding's Turtle, Five-lined Skink, Fox Snake, Hognose Snake and Massasauga Rattlesnake have been confirmed in the study area. At least one SAR plant species may occur within wetlands in the study area, although it cannot be confirmed until August or September.

Early indications are that wildlife SAR may be broadly distributed throughout the study area, occupying specific suitable habitats within the mosaic of upland and wetland that characterizes the local terrain. Baseline ecological investigations may benefit from incidental and focused confirmation of species presence; however detailed identification of specific habitats and occurrences is likely to be focused during an iterative detailed design and "tweaking" of the Project layout. This approach is proposed to address fish habitat and wildlife habitat for plants, amphibians, reptiles, birds and mammals, as detailed avoidance and mitigation strategies are developed using known species-specific life history and habitat associations. Avoidance of critical habitats to the extent possible will be a key strategy, in combination with identification and use of timing windows to avoid harm to sensitive seasonal life stages (e.g., nests) or during vulnerable periods (e.g., hibernation, gestation). Where sensitive habitats may be disturbed, focused mitigation may include relocation of individual specimens and associated habitat elements such as cover items (e.g., rocks and logs) outside of the work area. Mitigation/avoidance strategies throughout the Project phases will shift from early identification of broad preliminary constraints at a landscape level to the site-by-site implementation of mitigation plans during design, assessment and construction of access roads, watercourse crossings, turbines and transmission infrastructure. It is anticipated that ongoing consultation with CWS will occur throughout the project in relation to these species.

1.0 Terrestrial Field Program

Stantec Consulting Ltd. ("Stantec") is providing this work plan to Environment Canada for the terrestrial field investigations for the 300 MW, Feed-In Tariff ("FIT") Contracted, Henvey Inlet Wind Project (the "Project"). The key Project elements include:

i) *On-Reserve Facilities:* up to 120 wind turbines, a transformer station, operations and maintenance building, access roads, collector lines, and ancillary facilities on Henvey Inlet First Nation Lands (Reserve No. 2); and

ii) *Off-Reserve Facilities:* approximately 90 km of 230 kV, double circuit overhead transmission line from Reserve No. 2 to the Town of Parry Sound, Ontario where the project will interconnect with the provincial electricity grid at Hydro One Networks Inc.'s ("Hydro One") existing Parry Sound Transformer Station. The transmission line, as presently proposed, would be located within the current and future rights-of-way held by the Ontario Ministry of Transportation for King's Highway 69/400.

Save the Project's transmission line and interconnection works at the Parry Sound Transformer Station, all Project infrastructure will be located on Henvey Inlet First Nation Reserve Lands (Reserve No. 2). Preliminary siting of the wind turbines, collector lines, operations and maintenance building, transformer station, and access roads are in progress and are taking into account important cultural and environmental features as they are identified through field surveys, traditional ecological knowledge studies, and engagement efforts with the Henvey Inlet First Nation community.

For the transmission line, as proposed to be located within the current and future rights-of-way held by the Ontario Ministry of Transportation for King's Highway 69/400, the natural heritage field investigations for the majority of the transmission corridor fall under the requirements of Ontario Regulation 116/01 of Ontario's *Environmental Assessment Act* and will therefore be subject to review and approval by the Ministry of the Environment. However, portions of the highway corridor traverses roughly 35 ha of the Magnetewan First Nation Reserve (No. 1) and about 11 ha of the Shawanaga First Nation Reserve (No. 17), lands which are under federal jurisdiction.

Throughout this document, the wind project component on the Reserve Lands will be referred to as the Project Location and the transmission line corridor will be referred to as the Transmission Line. Collectively, these areas will be referred to as the Study Area for the purpose of the terrestrial survey work program.

The Project Location and Transmission Line alignment are shown on **Figure 1**.The purpose of the natural environment field program is to collect data relevant to vegetation communities (ecosites), wetlands, wildlife habitat, and Species at Risk. The objective of this work plan is to seek Environment Canada's agreement with the study methodologies and protocols set out herein for terrestrial investigations of the Project during the late winter, spring, summer and fall of 2013.

2.0 Field Program Overview

The Project Location is within the Henvey Inlet First Nation Reserve along the eastern shore of Georgian Bay, south of French River Provincial Park and directly north of North Georgian Bay Shoreline and Islands Conservation Reserve. Generally, the Project Location has shallow soils, with many rocky outcrops forming longitudinal ridges running on a northwest to southeast axis, and is divided roughly in half by Henvey Inlet. Numerous wetland pockets are located between the ridges and across the Project Location, with upland areas supporting forested areas of poplar and jack pine.

The characteristics of terrestrial habitat and areas of potential significance or sensitivity will first be identified as part of the early-on consultation with Henvey Inlet First Nations and relevant agencies, as well as a review of the available natural heritage information. Information gained through the consultation process and desktop review will be supplemented by general aerial and ground-level (by foot or boat) surveys of the Study Area to fine-tune the field program and assist in siting monitoring stations. Wildlife and vegetation surveys will begin in March, when raptors begin their spring migration and will continue into November, when the final fall migratory waterfowl are expected to move through the Study Area.

2.1 ECOSITE CLASSIFICATION AND WETLANDS

Ecosite classification forms the backbone of wildlife habitat assessment. For the Project, the Ecosites of Ontario classification system (Banton *et al.*, 2009) will be used as it includes forest and non-forest communities as well as wetlands.

A wetland is land that is saturated with water long enough to promote wetland or aquatic processes as indicated by poorly drained soils, hydrophytic vegetation and various kinds of biological activity which are adapted to a wet environment (The Federal Policy on Wetland Conservation (“FPWC”), Environment Canada, 1991). The protection and conservation of wetlands on federal lands is mandated by the FPWC. Mitigation of adverse environmental effects on wetlands is guided by the FPCW goal of achieving ‘no net loss of wetland functions’. The no net loss principal can be achieved by using a hierarchical sequence of mitigation alternatives: avoidance, minimization, and compensation. Wetlands on federal lands can be described using The Canadian Wetland Classification System (National Wetlands Working Group, Second Edition, 1997).

Provincially, the Ontario Wetland Evaluation System (Ministry of Natural Resources, 2002), is used to map and score wetlands based on biological productivity and diversity, human use, hydrologic functions, and unique characteristics such as geographical rarity. It is anticipated that no wetlands have been evaluated using the OWES on the Henvey Inlet First Nation Reserve Lands.

2.2 WILDLIFE HABITAT

Wildlife habitat is defined as an area where plants, animals and other organisms live, including areas where species concentrate at a vulnerable point in their life cycle and that are important to migratory and non-migratory species. The work program has been designed to capture those wildlife species and their habitats which may occur in the Study Area and may be influenced by the Project.

2.3 ENDANGERED, THREATENED AND SPECIAL CONCERN SPECIES

A desktop review of the MNR Natural Heritage Information Centre (NHIC) database, as well as provincial atlases for breeding birds, mammals, reptiles and amphibians, was conducted to identify species of conservation concern in the vicinity of the Study Area. Twenty-seven terrestrial species listed as endangered, threatened or special concern at the provincial and federal level have the potential to occur within the Study Area (**Table 1**). Several of these species were recorded within the Project Location during previous terrestrial field investigations by LGL Limited. Site investigations in the proposed 2013 terrestrial work program will assess the presence and identify preferred habitat of these species.

Table 1: Endangered, threatened and special concern terrestrial wildlife species potentially present within the Study Area

Type	Common Name	Scientific Name	S - Rank	COSSARO	COSEWIC

COSSARO: Committee on the Status of Species at Risk in Ontario
COSEWIC: Committee on the Status of Endangered Species in Canada
S2 – Imperiled in the nation or state/province because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province.
S3: Vulnerable—Vulnerable in the province, relatively few populations (often 80 or fewer)
S4: Apparently Secure—Uncommon but not rare
S5: Secure—Common, widespread, and abundant in the province
S#B: Breeding status rank
S#N – Non-breeding status rank
S? – Rank Uncertain
NAR: Not At Risk
END: Endangered
THR: Threatened
SC: Special Concern
N/A: not applicable
NS: Not on Species at Risk Act Schedule

3.0 Proposed Field Work Program

Due to the known presence of Species at Risk, the project is considered to have "Very High" site sensitivity and would be ranked as "Category 4" by Environment Canada's "Wind Turbines and Birds: A Guidance Document for Environmental Assessment" (2007a). Projects in this category usually require comprehensive baseline surveys; a requirement that has been considered in the development of this work program.

The survey protocols are consistent with Environment Canada's "Recommended Protocols for Monitoring Impacts on Wind Turbines on Birds" (Environment Canada, 2007b) and on Environment Canada's comments on LGL Limited's 2011 workplan for the Project. Recommended protocols for species at risk are based on Stantec's technical expertise and on experience with the Ministry of Natural Resources species-specific surveys requirements.

Detailed protocols of each survey type are outlined below. The suite of surveys proposed along the Transmission Line differs slightly than those within the Project Location, due to differences in potential environmental effects. For example, migratory bird surveys are not proposed along the Transmission Line. **Table 4** provides a summary of all proposed surveys, including a breakdown of which surveys are to be conducted within the Project Location and those to be conducted along the Transmission Line.

3.1 GENERAL RECONNAISSANCE (EARLY APRIL)

Given the limited access in and around the Project Location and the relatively rugged topography and abundance of wetlands in the Study Area, multi-purpose broad-scale surveys will be completed to obtain an overall understanding of the landscape, and to put the detailed field study locations in context.

An aerial survey by helicopter will be conducted in early April to observe the landscape without leaf cover and at a time of pronounced hydrological activity (i.e. spring melt). Leaf-off conditions will also allow a search for habitat features such as stick nests and wetland types. A reconnaissance survey of the Project Location by boat and foot will be undertaken in early April, guided by local members of the Henvey Inlet First Nations. The purpose of the reconnaissance survey will be to gain a better understanding of site access and points of interest, including locations of rare species, based in local knowledge.

3.2 SPRING MIGRATORY BIRD SURVEYS

3.2.1 Spring raptor migration (Ten surveys, early March to end of April):

Monitoring will consist of ten surveys throughout the spring migration period (March to end of April) to record presence of diurnal migrant raptors. Surveys will be comprised of six-hour point counts starting at 9:00 am, conducted by two observers stationed at two appropriate vantage

points within the Project Location. When site access allows, surveys stations will be situated in the east and west portions of the Project Location. However, during times of year when site access is limited (i.e. late winter, early spring) alternative locations may be used with efforts to maximize spatial coverage.

All raptors observed during the surveys will be recorded and mapped. Behaviour of the raptors will be noted with emphasis on flight height and determining which individuals were actively migrating as opposed to staging (e.g. hunting, perching, etc.). For actively migrating raptors, flight paths will be mapped.

3.2.2 Spring passerine migration (Eight surveys, early April to late May):

Natural habitat located in close proximity to the Georgian Bay shoreline provides stopover habitat for migrating passerine birds. Eight weekly surveys are proposed in April and May. Monitoring will consist of ten, 500m long transects distributed throughout the Project Location. Transects will be placed in different habitat types (i.e. woodland, rock barren and wetland). Given the variable nature of vegetation communities within the Project Location, it is likely most 500m transects will include more than one habitat type. A description of the habitat along each of the 10 transects will be recorded.

Surveys will be conducted in the morning, between dawn and approximately 10:00 am. A tally of all species observed will be recorded on each transect. These surveys will include characterizing the abundance and diversity of passerines within the Project Location.

3.2.3 Spring waterfowl migration (Four surveys, April to late May):

Spring monitoring for migrating waterfowl will be focused along Henvey Inlet and will consist of four bi-weekly surveys undertaken by boat in April and May. Surveys will include waterfowl counts to record species and number of individuals observed along the inlet, as well as characteristics of the wetlands to support migrating waterfowl (e.g. size, vegetation, permanence, etc.).

The use of scattered wetlands and ponds throughout the Project Location by staging waterfowl will be assessed through the spring passerine surveys.

3.3 BREEDING BIRD SURVEYS

3.3.1 Daytime breeding birds (Two surveys, late May to early July):

Two rounds of breeding bird surveys will be conducted in each major habitat type with the Study Area (woodland, rock barren and wetland). Surveys will consist of ten-minute point counts, in conjunction with area searches (wandering transects) between point count locations. The area searches will allow for collection a comprehensive species list, whereas point counts will provide information on species density.

Surveys would take place starting 30 minutes before sunrise and continue until approximately 10:00 am. As per Environment Canada guidance, a minimum of 20 point counts will be sited in each major habitat type. However, given the variability of habitat types that occur within the Study Area, it is anticipated that many point counts may cover more than one habitat type.

In marsh habitat, play-back call surveys for marsh breeding birds will be conducted following the ten-minute point count, to assist in detection or more secretive marsh bird species, specifically, the threatened Least Bittern.

Location of all species at risk observations will be geo-referenced using a hand-held GPS unit, mapped and compared to ecosite classification to develop habitat mapping for each species.

3.3.2 Crepuscular breeding birds (Two surveys, May and June):

Eastern Whip-poor-will surveys will be conducted in suitable open habitat within forested areas. Surveys will be conducted in May and June and will consist of six-minute point counts at stations spaced within the Project Location and Transmission Line corridor. Due to the remote location of much of the Study Area, survey locations may be selected with consideration to access and surveyor safety.

Surveys will begin approximately 30 minutes after sunset within appropriate weather conditions (not in high winds, persistent rain or an overcast sky) and will, if possible, coincide with the full moon. All individuals heard will be recorded, with an estimated direction and distance from the observer.

3.3.3 Owls (One survey, April):

Given the difficulty in detecting owl species, the use of playback calls to elect a response will be used. A single survey in April is proposed, and will include various stations throughout the Project Location. Due to the remote location of much of the Study Area, survey locations may be selected based on facility of access and surveyor safety.

Surveys will begin approximately 30 minutes after dark and will consist of 10 minute point counts incorporating playback and periods of silent listening. All individual heard will be recorded, with an estimated direction and distance from the observer.

3.3.4 Raptor and colonial nesting birds (Two surveys, April and June):

Searches for large stick nests or “nest bowls” in trees, typically exhibiting a DBH (diameter at breast height) of >50 cm, will be conducted during the aerial reconnaissance prior to leaf-out. Searches will target trees along watercourses, with special attention afforded to large white pines, and swamps along large bodies of water, as well as other appropriate habitat within the Study Area. If present, nests will be surveyed for activity concurrent with breeding bird point counts and area searches in June.

3.4 AMPHIBIAN AND REPTILE SURVEYS

3.4.1 Western Chorus Frog and Salamanders (April):

Western Chorus Frog surveys will consist of 3-minute call counts at potential breeding habitat conducted in April, during appropriate weather conditions. This species breeds in small or shallow aquatic habitats associated with moist, open terrestrial habitat (COSEWIC, 2008c). Males call from the water and are typically active when air temperatures are above 5°C, although calls have been detected at air temperatures as low as -1°C (COSEWIC, 2008c).

Unlike many anurans, Western Chorus Frogs are generally very active throughout the day. As such, daytime survey will be used to cover larger portions of the Study Area than evening call surveys would permit.

Surveys for amphibian egg masses will take place concurrent with calling surveys. These will consist of perimeter surveys of suitable breeding ponds by trained field personnel. Egg masses of different species are often characteristic based on features such as where they are laid, how many eggs are in the mass, density of the egg mass, and whether or not the eggs are encased in jelly.

3.5 REPTILE HABITAT AND TARGETED SURVEYS (MAY AND JUNE):

Reptile habitat and targeted species surveys will take place in three stages.

Preliminary surveys for reptiles will also take place throughout the migratory and breeding bird survey periods. Field biologists familiar with reptile species identification will be conducting area searches and wandering transect surveys in a variety of areas providing habitat for reptiles at both the Project Location, weekly from early April until early July, and along the Transmission Line, weekly from late May until early July. Any incidental observations of turtles, snakes or lizards, including shed skins or shells, will be recorded on survey forms and used to refine the field survey program proposed for June.

Potential snake or turtle habitat within the Study Area will also be identified during Ecosite surveys, beginning in May. The habitat assessment will involve identification of potential reptile habitat features, including:

- Turtle overwintering habitat and snake/skink hibernacula;
- Nesting sites; and,
- Foraging habitats.

Targeted field surveys for reptile species at risk will occur in June. Timing of these surveys will coincide with a period of high activity for reptiles (nesting and foraging), but also when air temperatures encourage basking behavior. Surveys for snake species at risk and Five-lined Skink will consist of wandering transects through all appropriate habitat types (**Table 2**).

Additional survey effort will be directed toward areas with previous observations of these species which may indicate high quality or limited habitat. To the extent possible, surveys will be conducted on sunny days when air temperatures are a minimum of 15°C (ideally 20°C). Surveys for turtles will consist of daytime basking surveys from land or boat in suitable wetland and open water habitat (**Table 2**), and evening nesting surveys in potential upland nesting sites identified during Ecosite surveys. Basking surveys will be conducted on sunny days when air temperatures are a minimum of 15°C (ideally 20°C). Nesting surveys will take place on warm evenings (daytime air temperature >20°C), ideally before or after rainfall. All surveys will record species, number, location and behaviour of observed reptiles.

The purpose of the targeted surveys is to confirm habitat used by the various reptile species at risk within the Study Area and provide information on general abundance and distribution. Survey results will be used to produce detailed mapping of reptile habitat features which will be used to guide the siting layout process and maximize avoidance of sensitive features.

Table 2: General Habitat Description and Use by Reptile Species at Risk

Common Name	General Habitat and Use*
Turtles	
[redacted]	[redacted]
Blanding's Turtle	Lakes, ponds and wetlands with clear shallow water and muck bottoms. Will move between habitats within active season; aerial basking; nesting in late May to early July, in open sandy soil up to 2.5km from primary wetland, but typically within 400m of water; overwinter in marsh, bog or fen with >0.5m water depth.
Stinkpot	Shallow water in rivers, lakes and ponds with slow current and soft bottom; aquatic basking, often under floating vegetation; nesting in June, in shallow soil near water, occasionally in or under leaf litter; overwinter in primary habitat with muck bottom.
Northern Map Turtle	Large rivers and lakes with soft bottom; aerial basking; nesting June and July in sandy soil; overwinter in general habitat in areas with >5m water depth.
Snapping Turtle	All aquatic habitats, but rarely in moving water, prefer large water bodies associated with marsh and/or swamp; aquatic basking
Snakes and Lizard	
Eastern Hog-nosed Snake	Open forest and forest edges with sandy soil in proximity to water; egg-laying in late June and July in nests excavated in sandy soil, often under cover objects; hibernation in mammal burrows.
Eastern Foxsnake	Georgian Bay populations inhabit rock barrens with sparse trees and shrubs in close proximity to shoreline; basking under or near rocks or in rock crevices; egg-laying late June to July in rock crevices or decaying vegetation; communal hibernation in rock crevices near shoreline.
Eastern Massasauga	Georgian Bay populations use rock barrens, wetlands and shorelines; viviparous, bearing young in late summer; communal gestation under rock cover; hibernation in rock crevices or animal burrows where water level is close to surface.
Eastern Ribbonsnake	Wetland edges with low vegetation and open basking areas; often seen swimming; viviparous, bearing young in late summer; hibernation in rock crevices and mammal burrows.

Table 2: General Habitat Description and Use by Reptile Species at Risk

Common Name	General Habitat and Use*
Milksnake	Forest edges and open meadow; bask under cover objects; egg-laying May to July in loose soil, decomposing wood or vegetation; hibernation in rock crevices and mammal burrows, often communally and with other species.
Five-lined Skink	Open forest and rock barren; abundance of cover objects (rocks and woody debris) is important, longer/larger cover is preferred; nesting in shallow soil under cover objects.

* Habitat description and use data obtained from COSEWIC assessment and status reports.

3.6 BAT SURVEYS (TWO SURVEYS, JUNE):

Bat surveys will be conducted in conjunction with Whip-poor-will surveys. A portable, hand-held broad band acoustic monitor will be used to detect bat calls. Recorded bat calls will be analysed to guild or species, where possible, following completion of the field program. The goal of the bat surveys will be to determine the presence and relative abundance of bat species at risk.

3.7 ECOSITE, WETLAND AND VEGETATION SURVEYS

3.7.1 Ecosite Classification, including Wetlands (May to July):

Vegetation communities within the Study Area will be delineated on aerial photographs and confirmed during field investigations. Community characterizations will be based on the Ecosites of Ontario system (Banton et al., 2009) and will be identified to the Vegetation Type unit level.

The Ecosites of Ontario classification system includes wetlands. Searches for wetlands not previously identified within the Study Area will be conducted as part of the Ecosite surveys. If encountered, previously unidentified wetlands will be recorded through field notes, photographs and geo-referenced using handheld GPS units.

3.7.2 Rare flora (May to July):

Searches for rare plants and habitat supporting these plants will be conducted concurrent with Ecosite surveys, where possible, but may also require spring assessments for ephemeral species or mid-summer assessments for species where identification is dependent on the flowering period of the species. If encountered, rare plants or habitat will be recorded through field notes, photographs and geo-referenced using handheld GPS units.

A review of the MNR Natural Heritage Information Centre (NHIC) database (NHIC, 2012) indicates that two provincially rare vegetation communities are known to occur within the Study Area:

- Atlantic Coastal Plain Shallow Marsh Type; and,
- Buttonbush Organic Thicket Swamp Type

The following rare plant species (**Table 3**) may also be encountered in the Study Area:

Table 3: Rare Plant Species and Flowering Period

Common Name	Scientific Name	Flowering Period
Flowering Plants		
St. Lawrence Grape Fern	*Botrychium rugulosum*	Mid-Spring
Thread-like Naiad	*Najas gracillima*	Summer to Fall, seeds important to ID so survey at end of period
Large Round-leaved Orchid	*Plantathera macrophylla*	June to August
Snailseed Pondweed	*Potamogeton bicupulatus*	Early Summer to Fall, seeds important to ID so survey at end of period
Alga Pondweed	*Potamogeton confervoides*	Summer, seeds important to ID so survey at end of period
Twin-stemmed Bladderwort	*Utricularia geminiscapa*	July to August
Liverworts		
Liverwort sp.		Unknown, best period for general identification is June-August

3.8 FALL MIGRATORY BIRD SURVEYS

3.8.1 Fall passerine migration (Eight surveys, end of August to mid October)

Natural habitat located in close proximity to shorelines provides stopover habitat for migrating birds. Eight weekly surveys are proposed between the end of August and mid October. Monitoring will consist of ten, 500 m long transects distributed throughout the Project Location. The same transects will be used as in the Spring Passerine Migration surveys.

Survey will be conducted in the morning, between dawn and approximately 10:00 am. A tally of all species observed will be recorded on each transect. These surveys will include characterizing the abundance and diversity of passerines within the Project Location.

3.8.2 Fall waterfowl migration (Six surveys, September to October):

Fall monitoring for migrating waterfowl will be focused along Henvey Inlet and will consist of four bi-weekly surveys undertaken by boat in September through October. Surveys will include waterfowl counts to record species and number of individuals observed along the inlet, as well as characteristics of the wetlands to support migrating waterfowl (e.g. size, vegetation, permanence, etc.).

The use of scattered wetlands and ponds throughout the Project Location by staging waterfowl will be assessed through the Fall Passerine surveys.

3.8.3 Fall raptor migration (Ten surveys, September to October):

Monitoring will consist of ten surveys throughout the fall migration period (September to October) to record presence of diurnal migrant raptors. Surveys will be comprised of six-hour point counts starting at 9:00 am, conducted by two observers stationed at two appropriate vantage points within the Project Location. When site access allows, surveys stations will be situated in the east and west portions of the Project Location.

All raptors observed during the survey will be recorded and mapped. Behaviour of the raptors will be noted with emphasis on flight height and determining which individuals were actively migrating as opposed to staging (e.g. hunting, perching, etc.). For actively migrating raptors, flight paths will be mapped.

3.9 INCIDENTAL OBSERVATIONS

In addition to targeted wildlife surveys described above, all incidental observations of terrestrial wildlife or other significant sightings made during surveys throughout the 2013 field season will be recorded. Notes will be taken on the species, number of individuals, locations and behavior. Observations made early in the field season may be used to refine the remainder of the field program.

Legend

1 ESA Status: The Endangered Species Act 2007 (ESA) protects Species at Risk (Threatened and Endangered) at a Provincial Level:
NAR - Not at Risk

2 SARA Status: The Species at Risk Act (SARA) protects Species at Risk (Special Concern, Threatened and Endangered) at a Federal Level. Species listed under Schedule 1 receive protection under SARA:
NAR - Not at Risk
THR - Threatened, A species likely to become endangered if nothing is done to reverse the factors leadings to its extirpation and extinction

3 S-rank: The natural Heritage provincial ranking system (provincial S-rank) is used by the MNRF Natural Heritage Information Centre (NHIC) to set protection priorities for rare species. Definitions are as follows:
S3 - Rare to uncommon in Ontario; usually between 20 and 100 occurrences in Ontario; may be susceptible to large-scale disturbances. Most species with an S3 rank are assigned to the watch list, unless they have a relatively high global rank.
S4 - Apparently Secure—Uncommon but not rare; some cause for long-term concern due to declines or other factors.
S5 - Very common and demonstrably secure in Ontario

Note: Data were transcribed as recorded on the field notes provided by Stantec Consulting Ltd. (Stantec) to AECOM in October

Legend

1 ESA Status: The Endangered Species Act 2007 (ESA) protects Species at Risk (Threatened and Endangered) at a Provir
NAR - Not at Risk

2 SARA Status: The Species at Risk Act (SARA) protects Species at Risk (Special Concern, Threatened and Endangered)
NAR - Not at Risk
THR - Threatened, A species likely to become endangered if nothing is done to reverse the factors leadings to its extirpati

3 S-rank: The natural Heritage provincial ranking system (provincial S-rank) is used by the MNRF Natural Heritage Informati
S3 - Rare to uncommon in Ontario; usually between 20 and 100 occurrences in Ontario; may be susceptible to large-scale
a relatively high global rank.
S4 - Apparently Secure—Uncommon but not rare; some cause for long-term concern due to declines or other factors.
S5 - Very common and demonstrably secure in Ontario
